Announcements

1) Unfortunately, Test 4 manually graded questions will NOT be done for Bonus Test 4, but I will release the Test questions back to you so you can use it for practice!

• Bonus Test 4 will be in class on Friday at 2 PM!

3) Lab 10 will be released in the next couple of days, it will be a GPA calculator that you have to create!

4) Reminder: your 10 best labs will be counted for your lab score.

 Lab 11 will be your final lab, where you build a portfolio of your work in labs this term.

Key Points

1) Use our knowledge to understand how popular applications and systems work: Amazon, Facebook, Twitter, BitTorrent, iPhone.

Amazon.com is America's largest online retailer and sells books, DVDs, software, and other products.

- Headquartered in Seattle, Washington.
- Founded by Jeff Bezos in 1994.

Overview

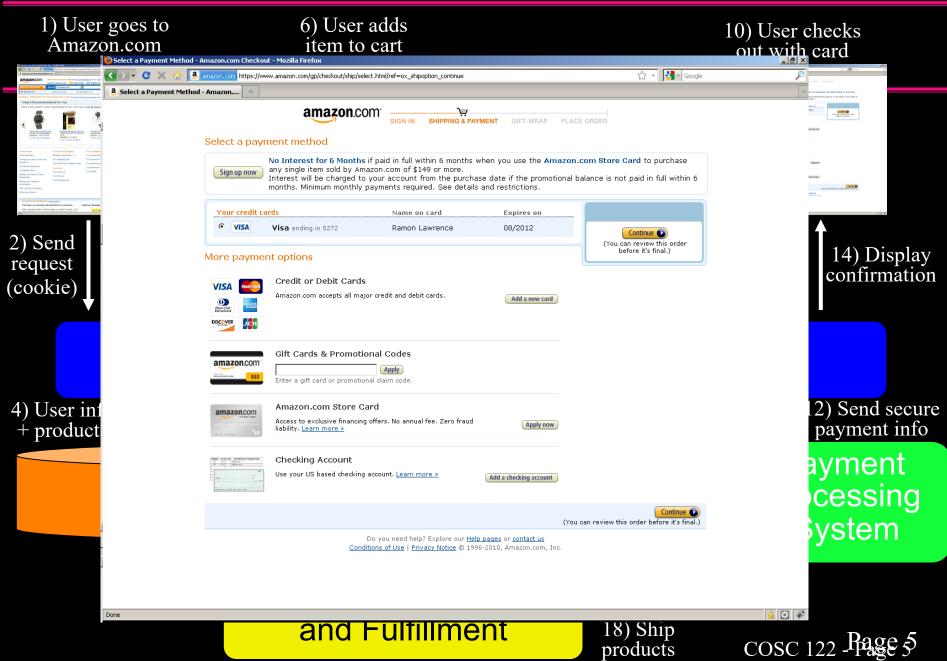

"Amazon" is named after the world's largest river.

Since 2000, Amazon's logo has an arrow from A to Z, representing customer satisfaction (as it forms a smile).

Amazon's Canadian site comes from the US, as it was legally prevented until March 2010 of operating any fulfillment centers in Canada. Products ship from Canada Post's Mississauga, ON.

Amazon provides technology and online hosting and services for many other retailers. Affiliates can sell through Amazon's system and link to Amazon's product database.

Amazon.com – How it Works

Facebook Overview

Facebook is a social networking site with over 1.1 billion active users as of June 2013.

- Allows users to create personal profiles, add people as friends and send messages and updates to them.
- Founded by Mark Zuckerberg in 2004.
- Revenue (\$5B+) from advertising (banner ads, news feed).
- Accessible directly or through applications on smartphones.
- 250+ billion user photos taking up more than 8 petabytes
 350 million photos added each day (50 terabytes)
- 4.5 billion likes per day

 Facebook Platform is an API (application programming interface) allowing developers to write own applications.

Currently more that 10 million applications with games being extremely popular.

Facebook.com – Like Button

User adds Like button to page

🖒 Like 📑 31,532 people like this. Be the first of your friends.

1) Configure Button

2) Added Code

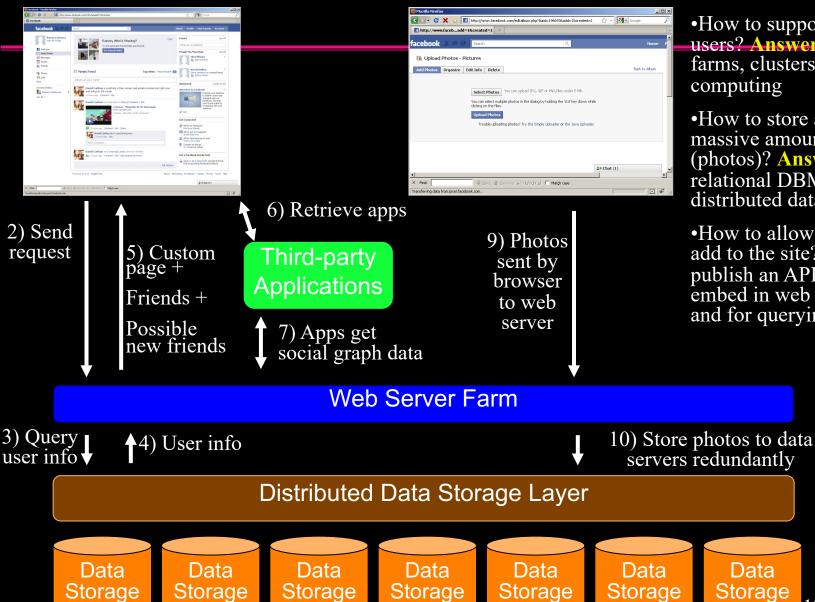

| Like Button Configurator | | Your Plugin Code |

When user clicks on Like request is sent to Facebook servers.

Build your own at: http://developers.facebook.com/docs/reference/plugins/like

Facebook.com – Applications

1) User goes to facebook.com

8) User uploads photos

Facebook CS Challenges:

•How to support a billion users? Answer: server farms, clusters, cloud computing

•How to store and retrieve massive amounts of data (photos)? Answer: beyond relational DBMSs, distributed data stores

•How to allow developers to add to the site? Answer: publish an API with code to embed in web sites (FBML) and for querying (FQL)

122 - Hage &

How do they make money?

Facebook and Google make billions of dollars of revenue from advertising.

Facebook advertising

 primarily banner advertising (display ads) and advertising in news feed.

 A company gets paid for banner advertising based on the number of displays ("impressions") and the number of user clicks ("click throughs").

"*Click through*" rates may be as low as 0.05% (Facebook). Each click may only represent \$0.10 to \$0.50 of revenue.

Google advertising

- primarily as sponsored results.
- Google gets paid each time a user clicks on a sponsored link.

A user clicks these ads an average of 8% of the time

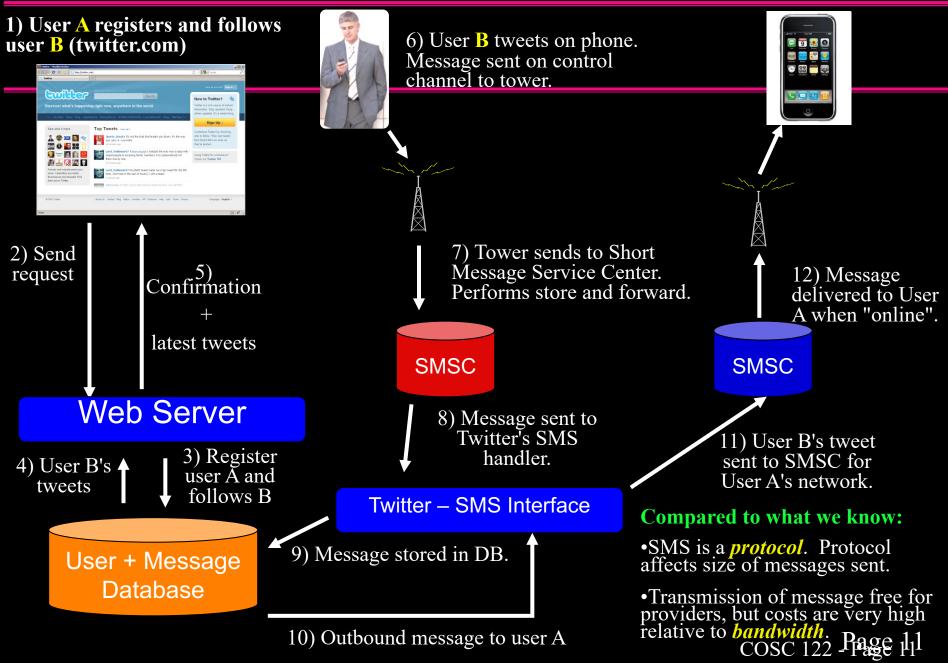

Companies make money due to the billions of page views and clicks.

Twitter Overview

Twitter is a social networking and blogging service that allows users to send and read user messages called tweets.

- Tweets are displayed on an user's page and can be up to 140 characters long (due to SMS compatibility).
- Users may subscribe (followers) to other user tweets.
- Tweets can be sent via the website, external applications (for smartphones/PCs), and the Short Message Service (SMS).
- Service is free but may be charged to use SMS or phone fees.
- Created in 2006 by Jack Dorsey.
- Currently has more than 500 million users and over 350 million tweets per day.

Twitter – How it Works

BitTorrent Overview

BitTorrent is a peer-to-peer file sharing protocol for data distribution. It is estimated to be the majority of Internet traffic.

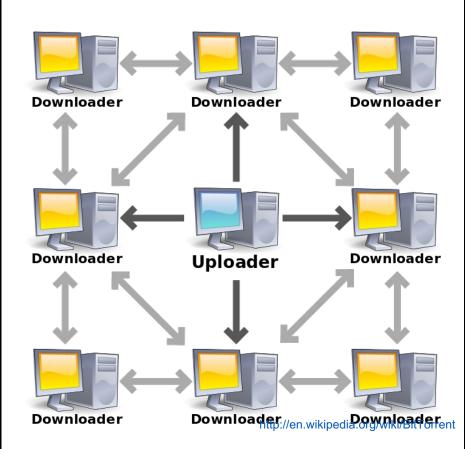

Basic idea: Instead of downloading a large file from one source, the file is downloaded in pieces from many sources and re-assembled. This improves performance and reliability.

A **BitTorrent tracker** is a server that keeps track of where file pieces reside on peer machines and which ones are available at time of the client request. A client need to first contact the tracker to initiate downloads.

BitTorrent^{**}

How it works:

- 1) A user creates a torrent descriptor file of the file to be shared. The file itself is put on a BitTorrent "seed" node and divided into pieces.
- 2) Another user downloads the torrent descriptor file and begins to download the file pieces. It may acquire pieces from other peers that had previously downloaded the file.
- 3) Once a peer has the complete file, it can function as a seed.

iPhone Overview

The *iPhone* is a *smartphone* manufactured by Apple that supports voice, text, browsing, email, and Wi-Fi. Distinctive features include its multi-touch screen, virtual keyboard, and thousands of third-party applications ("apps").

Smartphones are mini-computers that have an operating system capable of running programs both within and outside of a web browser.

 A major battle for market share between operating systems: Android, iPhone, Microsoft, Blackberry.

These devices are chosen more for their program capabilities and user interface features than phone service provider plans.

iPhone How it Works – Apps

1) An iPhone application is built by a developer in *Swift* or *Objective-C* programming language and compiled into a binary.

• Each smartphone platform supports a different language:

RIM/Android – Java

2) The application is verified by Apple, and if it passes, is loaded onto the App store.

3) Users search the store for applications and download and run the binary file on their device. An App runs on the device directly rather than in the browser.

What we have learned:

Basic programming skills (can be extended to develop apps)
 By 3rd year CS (or time on your own), you could do it.

Hardware components and how computer works/run programs

Components of applications and user interfaces COSC 122 - Page 15

Conclusion

We have investigated how some of the most popular systems and applications work. Each system requires *creativity* and a significant software *engineering effort* to design and build it.

We saw how the concepts we have learned in programming, computer systems, and networking/Internet are used in these systems and the research/technical challenges being faced.

Operational systems are continually improved, fixed for errors, and must remain working all the time. It takes considerable resources and people to operate.

The popular systems typically started from basic ideas and were expanded over time. It has never been easier to create a system and scale it up to millions of users.

Objectives

 Understand some of the ideas behind common applications and systems and how it relates to the concepts discussed in the course.

cosc 122 Computer Fluency

Databases

Dr. Firas Moosvi

Acknowledgement: Original slides provided courtesy of Dr. Lawrence and Dr. Abdallah Mohamed.

Key Points

1) Databases allow for easy storage and retrieval of large amounts of information.

2) Relational databases organize data into tables consisting of rows and columns.

3) SQL is the common language to query a database for results.

What is a database?

A **database** is a collection of logically related data for a particular domain.

A database management system (DBMS) is software designed for the creation and management of databases.
• e.g. Oracle, DB2, Microsoft Access, MySQL, SQL Server

Bottom line: A *database* is the *data* stored and a *database system* is the *software* that manages the data.

Databases in the Real-World

Databases are everywhere. Examples:

 Online web sites such as Amazon, eBay, and Expedia track orders, shipments, and customers using databases.
 eBay, with 5 petabytes (*Computerworld*, Oct 14, 2008)

Retailers manage their products and sales using a database.

Wal-Mart, with 2.5 petabyte. (Computerworld, Oct 14, 2008) Wal-Mart: Daily data from 800 million transactions by 30 million customers

 The university maintains all your registration information and marks in a database.

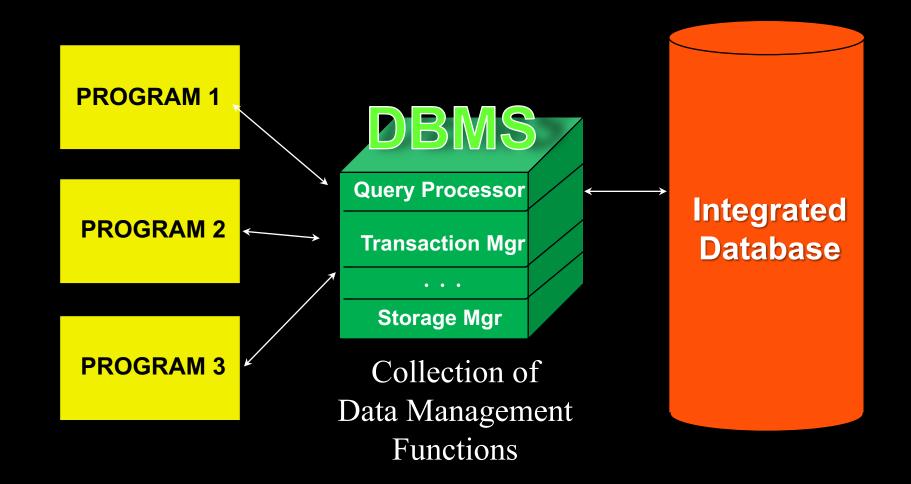

Can you think of other examples? What data do you have?

DBMS

A database management system provides *efficient*, *convenient*, and *safe multi-user* storage and access to *massive* amounts of *persistent* data.

Efficient - Able to handle large data sets and complex queries without searching all files and data items. *Convenient* - Easy to write queries to retrieve data. *Safe* - Protects data from system failures and hackers. *Massive* - Database sizes in gigabytes and terabytes. *Persistent* - Data exists even if have a power failure. *Multi-user* - More than one user can access and update data at the same time while preserving consistency.

Database System Approach

Advanced: Databases and Abstraction

One of the major advantages of databases is they provide data abstraction.

 Data abstraction allows the implementation of an object to change without affecting programs that use the object through an external definition.

That is, as a database user or programmer, you do not have to worry about how the data is stored or organized.

A DBMS achieves data abstraction by allowing users to define the database and then handling all the low-level details of how to store it, retrieve it, and handle concurrent access to it.

The Relational Model: Terminology

The *relational model* organizes database information into tables called relations.

 The relational model was developed by E. F. Codd in 1970 and is used by almost all commercial database systems.

Terminology:

A *relation* is a table with columns and rows.

An *attribute* is a named column of a relation.

A *tuple* is a row of a relation.

A *domain* is a set of allowable values for one or more attributes. The *degree* of a relation is the number of attributes it contains. The *cardinality* of a relation is the number of tuples it contains.

Relation Example

Tuples

| Id | name | salary | Province |
|------|-------|--------|----------|
| 2134 | Amy | 61000 | BC |
| 2137 | John | 62000 | AB |
| 3124 | Lee | 71400 | NL |
| 3234 | Lili | 51700 | AB |
| 1263 | Frank | 65000 | NL |

Attributes

Degree = 4 Cardinality = 5

Domains of Employee Relation Id – integer Name - string of alphabet characters Salary - currency. Province – set of provinces of Canada

Relation Example

Domain of Unit Price is *currency*.

Relation Practice Questions

| | 📰 Order : Select Query | | | | | | | | | | |
|----|------------------------|----------|----------|------------|--------------|----------|----------------------------|----------------------------|------------------|---|--|
| | Order ID | Customer | Employee | Order Date | Shipped Date | Ship Via | Ship Name | Ship Address | Ship Postal Code | | |
| | 10248 | VINET | 5 | 04-Aug-94 | 16-Aug-94 | 3 | Vins et alcools Chevalier | 59 rue de l'Abbaye | 51100 | | |

| Re | cord: 🚺 🖣 | 1 | • • • • | of 827 | · -· | - | | | | | |

- 1) What is the name of the relation?
- 2) What is the cardinality of the relation?
- 3) What is the degree of the relation?

4) What is the domain of order date? What is the domain of order id?

Databases Database and Database System

Question: Which of these two definitions below are an example of software?

A) database

B) database system

Databases Database Properties

Question: True or False: The data in a database is lost when the power to the computer is turned off.

A) true

B) false

Databases Database Properties (2)

Question: True or False: More than one user can use the database managed by the DBMS at the same time.

A) true

B) false

Databases Definition Matching

Question: Given the three definitions, select the ordering that contains their related definitions.

Relation, Tuple, Attribute

A) column, row, table
B) row, column, table
C) table, row, column
D) table, column, row

Databases Cardinality and Degree

Question: A database table has 10 rows and 5 columns. Select *one* true statement.

A) The table's degree is 50.

B) The table's cardinality is 5.

C) The table's degree is 10.

D) The table's cardinality is 10.

Keys are used to *uniquely identify* a tuple in a relation.

A **superkey** is a set of attributes that uniquely identifies a tuple in a relation.

A *key* is a *minimal* set of attributes that uniquely identifies a tuple in a relation.

A key is always a superkey, but not vice versa.

Question:

• What is a key to identify a student in this class?

Databases Keys and Superkeys (2)

Question: True or false: It is possible to have more than one key for a table and the keys may have different numbers of attributes.

A) true

B) false

Databases Keys and Superkeys

Question: True or false: A key is always a superkey.

A) true

B) false

Example Relations

Relations:

emp (eno, ename, bdate, title, salary, supereno, dno)
proj (pno, pname, budget, dno)
dept (dno, dname, mgreno)
workson (eno, pno, resp, hours)

Emp - one row per employee storing name, birth date, supervisor, and department that they are in

Proj - one row per project storing name and its department

Dept - one row per department storing name and manager WorksOn - stores that an employee works on a particular project for a certain amount of time in a given role Note: Key fields are underlined.

Example Relation Instances

Emp Relation

| eno | ename | bdate | title | salary | supereno | dno |
|-----|-----------|----------|-------|--------|----------|------|
| E1 | J. Doe | 01-05-75 | EE | 30000 | E2 | null |
| E2 | M. Smith | 06-04-66 | SA | 50000 | E5 | D3 |
| E3 | A. Lee | 07-05-66 | ME | 40000 | E7 | D2 |
| E4 | J. Miller | 09-01-50 | PR | 20000 | E6 | D3 |
| E5 | B. Casey | 12-25-71 | SA | 50000 | E8 | D3 |
| E6 | L. Chu | 11-30-65 | EE | 30000 | E7 | D2 |
| E7 | R. Davis | 09-08-77 | ME | 40000 | E8 | D1 |
| E8 | J. Jones | 10-11-72 | SA | 50000 | null | D1 |

WorksOn Relation

| eno | <u>pno</u> | resp | hours |
|-----|------------|------------|-------|
| E1 | P1 | Manager | 12 |
| E2 | P1 | Analyst | 24 |
| E2 | P2 | Analyst | 6 |
| E3 | P3 | Consultant | 10 |
| E3 | P4 | Engineer | 48 |
| E4 | P2 | Programmer | 18 |
| E5 | P2 | Manager | 24 |
| E6 | P4 | Manager | 48 |

| P1 | Instruments | 150000 | D1 |
| P2 | DB Develop | 135000 | D2 |
| P3 | Budget | 250000 | D3 |
| P4 | Maintenance | 310000 | D2 |
| P5 | CAD/CAM | 500000 | D2 |

Dept Relation

| <u>dno</u> | dname | mgreno |
|------------|-------------|--------|
| D1 | Management | E8 |
| D2 | Consulting | E7 |
| D3 | Accounting | E5 |
| D4 | Development | null |

COSC 122 - Page 38

A Simple Query Language: Keyword Searching

Keyword (or English-language) *search* allows a user to type keywords or phrases and returns a best answer estimate.

| Coode | |
|---------------------------------|-----------------------------------|
| Canada | |
| j. doe employee | Advanced Search Language Tools |
| Google Search I'm Feeling Lucky | |

This works fairly well for web searches, although we lack precision. Precision is required for many applications.

Example: How would you return all employees with salary greater than 30,000 using keyword search?

SQL Overview

Structured Query Language or SQL is the standard database query language to retrieve *exact answers*.

SQL is a *declarative language* (non-procedural).

A SQL query specifies **WHAT** to retrieve but **not HOW** to retrieve it.

SQL is used by Microsoft Access.

Some basic rules for SQL statements:

 1) There is a set of reserved words that cannot be used as names for database fields and tables.

SELECT, FROM, WHERE, etc.

 2) SQL is generally case-insensitive. Only exception is string constants. 'FRED' not the same as 'fred'.
 3) SQL is free-format and white-space is ignored.

COSC 122 - Page 40

At the end of the slides for this week, there is some OPTIONAL content for you to explore if you're interested in databases!

Databases are fascinating structures and are the lifeblood of the internet, but are beyond the scope of COSC 122!

At UBCO, there is a whole course dedicated to Databases, COSC 304 taught by a leading expert in the field, Dr. Ramon Lawrence

Conclusion

A *database* is a collection of related data. A *database system* allows storing and querying a database.

The basic query operations are selection (subset of rows), projection (subset of columns), and join (combine two or more tables).

SQL is the standard query language for databases, although Microsoft Access also provides a graphical user interface.

Objectives

- Define: database, database system
- Explain how a DBMS achieves data abstraction.
- Define: relation, attribute, tuple, domain, degree, cardinality, superkey, key
- Given a relation, know its cardinality, degree, domains, and keys.

\star

Given a relational schema and instance be able to translate very simple English queries into SQL.

cosc 122 Computer Fluency

SQL (Optional content for 2022)

Dr. Firas Moosvi

Acknowledgement: Original slides provided courtesy of Dr. Lawrence and Dr. Abdallah Mohamed.

A query in SQL has the form:

SELECT (list of attributes)FROM (list of tables)WHERE (filter conditions)

Notes:

1) Separate the list of attributes and list of tables by commas.

♦ 2) The "*" is used to select all attributes.

COSC 122 - Page 45

SQL Retrieving Only Some of the Columns

The *projection operation* creates a new table that has some of the columns of the input table. In SQL, provide the table in the FROM clause and the fields in the output in the SELECT.

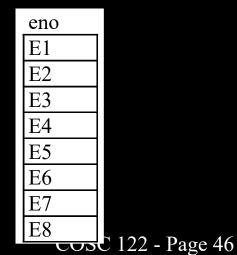

Example: Return only the eno field from the Emp table:

SELECT eno FROM emp

Emp Relation

| eno | ename | bdate | title | salary | supereno | dno |
|-----|-----------|----------|-------|--------|----------|------|
| E1 | J. Doe | 01-05-75 | EE | 30000 | E2 | null |
| E2 | M. Smith | 06-04-66 | SA | 50000 | E5 | D3 |
| E3 | A. Lee | 07-05-66 | ME | 40000 | E7 | D2 |
| E4 | J. Miller | 09-01-50 | PR | 20000 | E6 | D3 |

| E7 | R. Davis | ME | 40000 |
| E8 | J. Jones | SA | 50000 |

Databases Projection (2)

Question: Given this table and the query:

SELECT salary

FROM emp

How many rows are returned?

A) 0
B) 2
C) 4
D) 8

Emp Relation

| eno | ename | title | salary |
|-----|-----------|-------|--------|
| E1 | J. Doe | EE | 30000 |
| E2 | M. Smith | SA | 50000 |
| E3 | A. Lee | ME | 40000 |
| E4 | J. Miller | PR | 20000 |
| E5 | B. Casey | SA | 50000 |
| E6 | L. Chu | EE | 30000 |
| E7 | R. Davis | ME | 40000 |
| E8 | J. Jones | SA | 50000 |

SQL Projection Questions

WorksOn Relation

| eno | <u>pno</u> | resp | dur |
|-----|------------|------------|-----|
| E1 | P1 | Manager | 12 |
| E2 | P1 | Analyst | 24 |
| E2 | P2 | Analyst | 6 |
| E3 | P3 | Consultant | 10 |
| E3 | P4 | Engineer | 48 |
| E4 | P2 | Programmer | 18 |
| E5 | P2 | Manager | 24 |
| E6 | P4 | Manager | 48 |
| E7 | P3 | Engineer | 36 |
| E7 | P5 | Engineer | 23 |
| E8 | P3 | Manager | 40 |

<u>Write the SQL statement that:</u>
1) Returns only attributes *resp* and *dur*.
2) Returns only *eno*.
3) Returns only *pno*.

List the number of result rows and columns in each case.

One Table Query Example Retrieving Only Some of the Rows

The selection operation creates a new table with some of the rows of the input table. A condition specifies which rows are in the new table. The condition is similar to an i f statement.

Example: Return the projects in department 'D2':

SELECT pno, pname, budget, dno
FROM proj
WHERE dno = 'D2';

Proj Relation

| pr | <u>10</u> | pname | budget | dno |
|----|-----------|-------------|--------|-----|
| P | 1 | Instruments | 150000 | D1 |
| P | 2 | DB Develop | 135000 | D2 |
| P | 3 | Budget | 250000 | D3 |
| P | 4 | Maintenance | 310000 | D2 |
| P | 5 | CAD/CAM | 500000 | D2 |

Result

| pno | pname | budget | dno |
|-----|-------------|--------|-----|
| P2 | DB Develop | 135000 | D2 |
| P4 | Maintenance | 310000 | D2 |
| P5 | CAD/CAM | 500000 | D2 |
| | | | |

Algorithm: Scan each tuple and check if matches condition in WHERE clause. COSC 122 - Page 51

Retrieving Only Some of the Rows Selection Conditions

The condition in a selection statement specifies which rows are included. It has the general form of an if statement.

The condition may consist of attributes, constants, comparison operators (<, >, =, !=, <=, >=), and logical operators (AND, OR, NOT).

SQL Selection Examples

Emp Relation

| eno | ename | title | salary |
|-----|-----------|-------|--------|
| E1 | J. Doe | EE | 30000 |
| E2 | M. Smith | SA | 50000 |
| E3 | A. Lee | ME | 40000 |
| E4 | J. Miller | PR | 20000 |
| E5 | B. Casey | SA | 50000 |
| E6 | L. Chu | EE | 30000 |
| E7 | R. Davis | ME | 40000 |

Databases Selection

Question: Given this table and the query:

How many rows are returned?

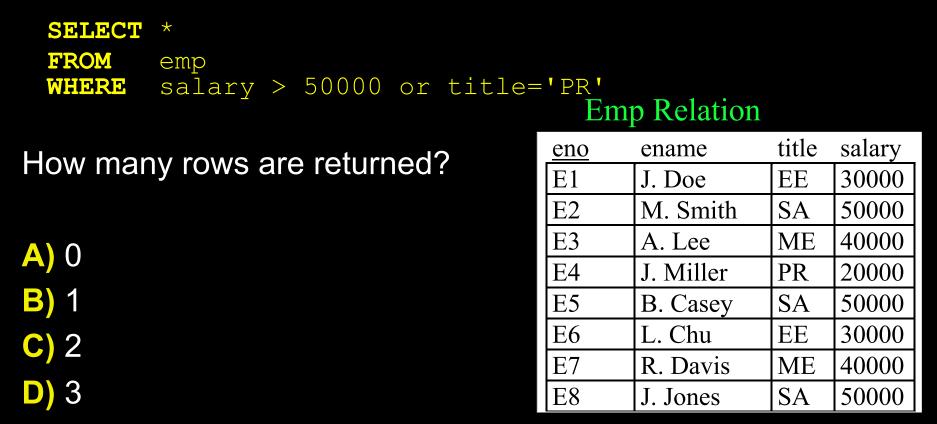

Emp Relation

| eno | ename | title | salary |
|-----|-----------|-------|--------|
| E1 | J. Doe | EE | 30000 |
| E2 | M. Smith | SA | 50000 |
| E3 | A. Lee | ME | 40000 |
| E4 | J. Miller | PR | 20000 |
| E5 | B. Casey | SA | 50000 |
| E6 | L. Chu | EE | 30000 |
| E7 | R. Davis | ME | 40000 |
| E8 | J. Jones | SA | 50000 |

A) 0 B) 1 C) 2 D) 3

Databases Selection

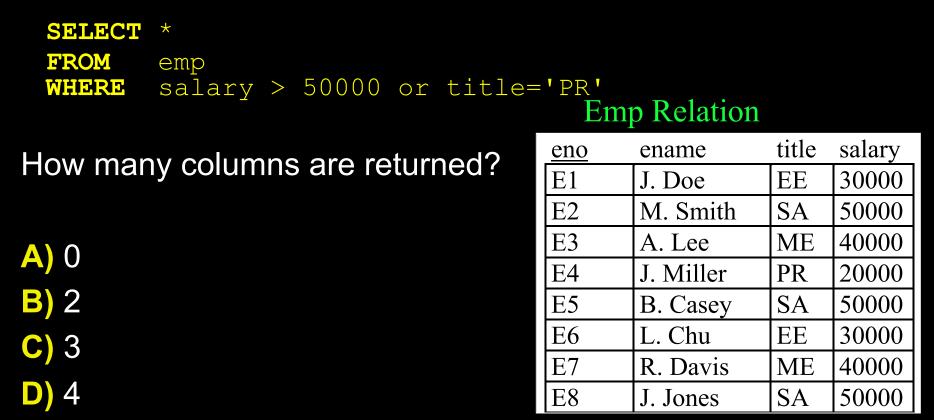

Question: Given this table and the query:

COSC 122 - Page 55

Databases Selection

Question: Given this table and the query:

SQL Selection Questions

WorksOn Relation

| eno | <u>pno</u> | resp | dur |
|-----|------------|------------|-----|
| E1 | P1 | Manager | 12 |
| E2 | P1 | Analyst | 24 |
| E2 | P2 | Analyst | 6 |
| E3 | P3 | Consultant | 10 |
| E3 | P4 | Engineer | 48 |
| E4 | P2 | Programmer | 18 |
| E5 | P2 | Manager | 24 |
| E6 | P4 | Manager | 48 |
| E7 | P3 | Engineer | 36 |
| E7 | P5 | Engineer | 23 |
| E8 | P3 | Manager | 40 |

Write the SQL statement that:
1) Returns all rows with a project P2.
2) Returns all rows with responsibility of a Manager.

3) Returns all rows with a responsibility of Manager **and** duration of more than 40 months.

List the number of result rows for each case.

COSC 122 - Page 57

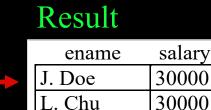

One Table Query Example Retrieving Some of the Rows/Columns

Return the employee name and salary of all employees whose title is 'EE':

SELECT ename, salary
FROM emp
WHERE title = 'EE';

Emp Relation

| eno | ename | bdate | title | salary | supereno | dno |
|-----|-----------|----------|-------|--------|----------|------|
| E1 | J. Doe | 01-05-75 | EE | 30000 | E2 | null |
| E2 | M. Smith | 06-04-66 | SA | 50000 | E5 | D3 |
| E3 | A. Lee | 07-05-66 | ME | 40000 | E7 | D2 |
| E4 | J. Miller | 09-01-50 | PR | 20000 | E6 | D3 |
| E5 | B. Casey | 12-25-71 | SA | 50000 | E8 | D3 |
| E6 | L. Chu | 11-30-65 | EE | 30000 | E7 | D2 |
| E7 | R. Davis | 09-08-77 | ME | 40000 | E8 | D1 |
| E8 | J. Jones | 10-11-72 | SA | 50000 | null | D1 |

One Table Query Examples

Return the birth date and salary of employee 'J. Doe':

SELECT bdate, salary
FROM emp
WHERE ename = 'J. Doe'

Return all information on all employees:

SELECT ** returns all attributesFROMemp

Return the employee number, project number, and number of hours worked where the hours worked is > 50:

| SELECT | eno, | pnc |), | hours |
|--------|-------|-----|----|-------|
| FROM | works | son | | |
| WHERE | hours | 5 > | 50 |) |

Databases Projection and Selection

Question: Given this table and the query:

SELECT eno, salary
FROM emp
WHERE salary >= 40000

What is the degree of the result?

Emp Relation

| eno | ename | title | salary |
|-----|-----------|-------|--------|
| E1 | J. Doe | EE | 30000 |
| E2 | M. Smith | SA | 50000 |
| E3 | A. Lee | ME | 40000 |
| E4 | J. Miller | PR | 20000 |
| E5 | B. Casey | SA | 50000 |
| E6 | L. Chu | EE | 30000 |
| E7 | R. Davis | ME | 40000 |
| E8 | J. Jones | SA | 50000 |

Databases Projection and Selection (2)

Question: Given this table and the query:

SELECT eno, salary
FROM emp
WHERE salary >= 40000

What is the cardinality of the result?

Emp Relation

| eno | ename | title | salary |
|-----|-----------|-------|--------|
| E1 | J. Doe | EE | 30000 |
| E2 | M. Smith | SA | 50000 |
| E3 | A. Lee | ME | 40000 |
| E4 | J. Miller | PR | 20000 |
| E5 | B. Casey | SA | 50000 |
| E6 | L. Chu | EE | 30000 |
| E7 | R. Davis | ME | 40000 |
| E8 | J. Jones | SA | 50000 |

SQL Projection/Selection One Table Questions

Relations:

emp (<u>eno</u>, ename, bdate, title, salary, supereno, dno) proj (<u>pno</u>, pname, budget, dno) dept (<u>dno</u>, dname, mgreno) workson (<u>eno</u>, <u>pno</u>, resp, hours)

1) Returns all employees making more than \$50,000.

2) Show the WorksOn records with less than 20 hours but more than 10 hours.

3) Return only the pno and dno for each project.

4) Return the name for each employee in department 'D1'.

5) Challenge: Display the employees who (make less than \$40,000 or have title 'EE') and are born after June 1, 1970.

◆ Dates are in YYYY-MM-DD format. e.g. '1970-06-01'

Join

A join combines two tables into a single table.

If the join has no condition that specifies which rows are in the result, all possible combinations of rows are in the result.

This is called a *Cartesian or cross product*.

 If table R has N rows and X columns and table S has M rows and Y columns, then there are N*M rows and X+Y columns in the cross product result.

In SQL, a cross product is done automatically if you put more than one table in the FROM clause and do not specify a condition on how to combine them.

In most cases, this is NOT what you want to do!

Cartesian Product SQL Example

Emp Relation

| eno | ename | title | salary |
|-----|-----------|-------|--------|
| E1 | J. Doe | EE | 30000 |
| E2 | M. Smith | SA | 50000 |
| E3 | A. Lee | ME | 40000 |
| E4 | J. Miller | PR | 20000 |

Proj Relation

| pno | pname | budget |
|-----|-------------|--------|
| P1 | Instruments | 150000 |
| P2 | DB Develop | 135000 |
| P3 | CAD/CAM | 250000 |

Databases Cartesian Product

Question: R is a relation with 10 rows and 5 columns. S is a relation with 8 rows and 3 columns.

What is the degree and cardinality of the cartesian product?

A) degree = 8, cardinality = 80

B) degree = 80, cardinality = 8

C) degree = 15, cardinality = 80

degree = 8, cardinality = 18

In most cases, you only want to combine two tables and have rows in the result that satisfy a certain condition.

The most common type of join is an **equijoin** that combines two tables by matching columns that have the same value.

- Equijoin gets its name because the columns are compared using the equality operator (=).
- ◆ e.g. WorksOn.pno = Proj.pno

Equijoin Example

WorksOn Relation

| eno | <u>pno</u> | resp | dur |
|-----|------------|----------|-----|
| E1 | P1 | Manager | 12 |
| E2 | P1 | Analyst | 24 |
| E2 | P2 | Analyst | 6 |
| E3 | P4 | Engineer | 48 |
| E5 | P2 | Manager | 24 |
| E6 | P4 | Manager | 48 |
| E7 | P3 | Engineer | 36 |
| E7 | P4 | Engineer | 23 |

Proj Relation

| <u>pno</u> | pname | budget |
|------------|-------------|--------|
| P1 | Instruments | 150000 |
| P2 | DB Develop | 135000 |
| P3 | CAD/CAM | 250000 |
| P4 | Maintenance | 310000 |
| P5 | CAD/CAM | 500000 |

| SELECT | * |
|--------|------------------------|
| FROM | WorksOn, Proj |
| WHERE | WorksOn.pno = Proj.pno |

| eno | pno | resp | dur | P.pno | pname | budget |
|-----|-----|----------|-----|-------|-------------|--------|
| E1 | P1 | Manager | 12 | P1 | Instruments | 150000 |
| E2 | P1 | Analyst | 24 | P1 | Instruments | 150000 |
| E2 | P2 | Analyst | 6 | P2 | DB Develop | 135000 |
| E3 | P4 | Engineer | 48 | P4 | Maintenance | 310000 |
| E5 | P2 | Manager | 24 | P2 | DB Develop | 135000 |
| E6 | P4 | Manager | 48 | P4 | Maintenance | 310000 |
| E7 | P3 | Engineer | 36 | P3 | CAD/CAM | 250000 |
| E7 | P4 | Engineer | 23 | P4 | Maintenance | 310000 |

What is the meaning of this join?

COSC 122 - Page 67

Equijoin in SQL

There are two ways of using equijoin in SQL. In WHERE clause:

SELECT *
FROM WorksOn, Proj
WHERE WorksOn.pno = Proj.pno

In FROM clause:

SELECT * FROM WorksOn JOIN Proj ON WorksOn.pno = Proj.pno

Can simplify syntax by using alias to shorten table name:

SELECT * FROM WorksOn AS W, Proj AS P WHERE W.pno = P.pno

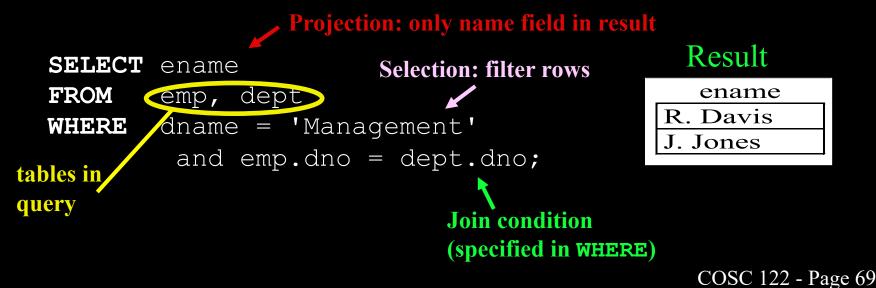

COSC 122 - Page 68

Join Query with Selection Example

You can use join, selection, and projection in the same query.

Recall: Projection returns columns listed in SELECT, selection filters out rows using condition in WHERE, and join combines tables in FROM using condition specified in FROM or WHERE.

Example: Return the employee names who are assigned to the 'Management' department.

Join Query Examples

Return the department names and the projects in each department:

SELECT dname, pname
FROM dept, proj
WHERE dept.dno = proj.dno

Return the employees and the names of their department:

SELECT ename, dname
FROM emp JOIN dept ON emp.dno=dept.dno

Return all projects who have an employee working on them whose title is 'EE':

| SELECT | pname |
|--------|-----------------------------------------------------|
| FROM | emp, proj, workson |
| WHERE | <pre>emp.title = 'EE' and workson.eno=emp.eno</pre> |
| | and workson.pno = proj.pno COSC 122 - Page 70 |

Join Practice Questions

Emp Relation

| eno | ename | title | salary |
|-----|-----------|-------|--------|
| E1 | J. Doe | EE | 30000 |
| E2 | M. Smith | SA | 50000 |
| E3 | A. Lee | ME | 40000 |
| E4 | J. Miller | PR | 20000 |
| E5 | B. Casey | SA | 50000 |
| E6 | L. Chu | EE | 30000 |
| E7 | R. Davis | ME | 40000 |
| E8 | J. Jones | SA | 50000 |

Proj Relation

| <u>pno</u> | pname | budget |
|------------|-------------|--------|
| P1 | Instruments | 150000 |
| P2 | DB Develop | 135000 |
| P3 | CAD/CAM | 250000 |
| P4 | Maintenance | 310000 |
| P5 | CAD/CAM | 500000 |

WorksOn Relation

| eno | <u>pno</u> | resp | dur |
|-----|------------|------------|-----|
| E1 | P1 | Manager | 12 |
| E2 | P1 | Analyst | 24 |
| E2 | P2 | Analyst | 6 |
| E3 | P3 | Consultant | 10 |
| E3 | P4 | Engineer | 48 |
| E4 | P2 | Programmer | 18 |
| E5 | P2 | Manager | 24 |
| E6 | P4 | Manager | 48 |
| E7 | P3 | Engineer | 36 |
| E7 | P5 | Engineer | 23 |
| E8 | P3 | Manager | 40 |

Compute the following joins (how many tuples?): 1) SELECT * FROM Emp JOIN WorksOn ON Emp.eno = WorksOn.eno 2) SELECT * FROM Emp, Proj, WorksOn WHERE Emp.eno = WorksOn.eno AND Proj.pno = WorksOn.eno AND

Ordering Result Data

The query result returned is not ordered on any column by default. We can order the data using the **ORDER** BY clause:

| SELECT | ename, | salary, | bdate |
|----------|--------|---------|-----------|
| FROM | emp | | |
| WHERE | salary | > 30000 | |
| ORDER BY | salary | DESC, e | name ASC; |

 'ASC' sorts the data in ascending order, and 'DESC' sorts it in descending order. The default is 'ASC'.

 The order of sorted attributes is significant. The first column specified is sorted on first, then the second column is used to break any ties, etc.

More Advanced Querying

There are many more queries that we can ask a database:

- compute expressions and functions
- group data by value and meaning
- compute summary (aggregate) functions (max, min, sum, etc.)
- subqueries (queries within queries)

We will not study the notation for this advanced querying.

Putting it All Together

The steps to write an English query in SQL are:

- ◆ 1) Find the columns that you need and put in SELECT clause.
- 2) List the tables that have the columns in the FROM clause. If there is more than one, join them together.
- 3) If you must filter rows, add a filter criteria in WHERE clause.

Example: List project name and budget where a 'Manager' is working on the project.

SELECT pname, budget
FROM WorksOn, Proj
WHERE resp='Manager' AND WorksOn.pno = Proj.pno

Practice Questions

Relational database schema:

emp (<u>eno</u>, ename, bdate, title, salary, supereno, dno) proj (<u>pno</u>, pname, budget, dno) dept (<u>dno</u>, dname, mgreno) workson (<u>eno</u>, <u>pno</u>, resp, hours)

Return the project names that have a budget > 250000.
 List all project names in department with name 'Accounting'.

3) For employee 'M. Smith' list the project number and hours for all projects that he worked on.

4) Return a list of all department names, the names of the projects of that department, and the name of the manager of each department.

Microsoft Access

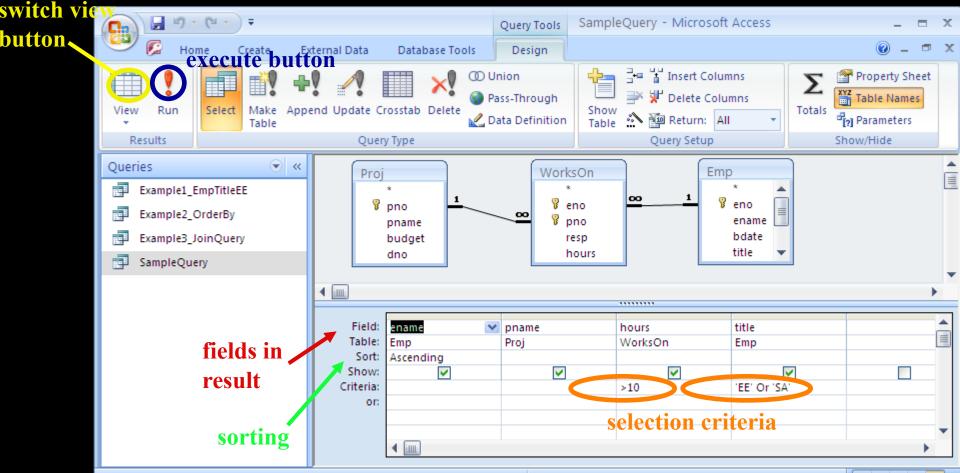

Microsoft Access is a simple database management system.

• It allows you to create databases, forms, reports, and programs.

| | | | Table Tools | Microsoft Access | | | | - | = X |

Microsoft Access Query Interface

Tables are boxes. Relationships are lines. Condition specified on bottom.

Form View

🖽 🖽 SQL 🔽

0

Microsoft Access Querying Basics

1) Projection is performed by selecting the fields in the output in the field row in the table at the bottom of the screen.

2) Selection is performed by entering the condition in the criteria box. The criteria applies to the field in that column.

3) The tables used are added to the query by the **Show Table**... option.

4) Joins (based on relationships) are often automatically added, but if not, you can add them by selecting the join field in one table, holding the mouse button, then dragging to the join field in the other table.

Microsoft Access Query Views

You may view your data, your query graphically, or your query in SQL.
